WELCOME TO ICML 2018 IN STOCKHOLM

Dear ICML attendees,

Welcome to Stockholm and the 35th International Conference on Machine Learning (ICML 2018)! It is a true pleasure to bring the premiere machine learning conference to Sweden and to reunite with you to share the latest breakthroughs in the field. This year is special as we are co-locating our meetings with the International Conference on Autonomous Agents and Multiagent Systems (AAMAS) and the International Joint Conference on Artificial Intelligence (IJCAI), with in particular a joint plenary session, and joint workshops. This is a great opportunity for further exchanges.

Technical Program

The core of the ICML 2018 conference is the main technical program of contributed papers, talks and posters. This year, ICML continues its rigorous and selective process for identifying impactful and technically sound papers to publish. All in all, ICML 2018 evaluated a recordbreaking total of 2473 submissions. Of these, 621 excellent articles (another record!) were accepted for publication and for presentation at the conference. Each accepted contribution is granted both an oral presentation (in one of 10 parallel tracks over three days of meetings) as well as a poster presentation (across 3 poster sessions during the evenings). Furthermore, all accepted articles will be published in the Journal of Machine Learning Research (JMLR) under its Workshop and Conference Proceedings series (PMLR).

The main ICML technical program also features four world-class keynote talks by invited speakers at the forefront of the field. We are thrilled to host presentations from the following distinguished luminaries: Dawn Song from the University of California, Berkeley, Max Welling from the University of Amsterdam, Josh Tenenbaum from the Massachusetts Institute of Technology and Joyce Chai from Michigan State University. The latter two speakers are presenting in a joint session shared with IJCAI and AAMAS.

Tutorials

The main technical program is preceded by a tutorials day featuring 9 tutorial sessions that cover core topics in machine learning today. Attendees will be brought up to speed on the latest advances in subjects including the theory of deep learning, imitation learning, variational Bayes, temporal point processes, algorithmic fairness, personalized health, automated pricing and auctions, nearest neighbor methods, and learning to control.

Workshops

The main technical program is followed by 67 workshops spread over three days of meetings. This year, these workshops are jointly organized by members of the ICML, IJCAI, ECAI, and AAMAS communities, and thus are ideal settings for attendees to gain perspectives and identify synergies across these different communities within artificial intelligence and machine learning. They are also ideal settings for attendees to see late-breaking work, hear about exploratory topics, and pursue collaboration opportunities.

Awards

We will present two best paper awards to honor some of the most promising research from the technical program. The best papers will be invited to a fast track for award winning papers in the Journal of Machine Learning Research. We will also present the ICML-2018 test of time award. This award is for the paper from the 2008 ICML conference (held at the University of Helsinki, Finland) that has retrospectively had a significant impact on our field. It goes to the paper "A Unified Architecture for Natural Language Processing: Deep Neural Networks with Multitask Learning" by Ronan Collobert and Jason Weston.

Acknowledgements

So many people contributed tremendously to make ICML 2018 a success, we are humbled and deeply thankful for their dedication and their hard work.

First of all, we would like to thank the crucially important service of the 160 distinguished members of the Senior Program Committee and the amazing Program Committee reviewers they collaborated with. All of them worked hard to give each paper at least three high-quality reviews as well as an extensive deliberation process that culminated in what was sometimes a very difficult decision. The complete list of all these members of the program committee is available on the ICML website. Through their efforts and worldclass expertise, program committee members help ensure ICML's technical quality and intellectual leadership in the field of machine learning.

Next, we would like to recognize and thank the entire Organizing Committee who put the conference together this year. The Local Chairs, Mary Ellen Perry and Fredrik Heintz were pivotal in securing the location in Stockholm and for much of the on-the-ground local work in Sweden. The Tutorial Chairs, Arthur Gretton and Ruslan Salakhutdinov coordinated with many distinguished speakers to put together a fantastic tutorials program for the first conference day. The Workshop Chairs, Finale Doshi-Velez and Kristian Kersting curated a wonderful list of 67 workshops, held together with IJCAI and AAMAS. Our Funding Chairs, Ryan Adams and Erik Sudderth, enlisted an amazing collection of sponsors and saved the day with the amount of financial support they secured. Many thanks to Shakir Mohamed and Iain Murray for their work as Publications Chairs and for putting together the proceedings volume at PMLR. Thanks also to Katherine Gorman and Neil Lawrence, who tremendously helped us cope with the significant media interest. Finally, we are indebted to our Workflow Chairs, Felix Berkenkamp and Yale Chang, who provided crucially helpful behind-the-scenes work for ICML.

We owe a special thank you to Mary Ellen Perry, the ICML Executive Director and Lee Campbell, the ICML IT Director. They are truly the backbone of this year's conference along with their team that work the meeting. Mary Ellen organized logistics, contracts, finances, negotiations, hotel arrangements, travel arrangements, video recording, and much more. Lee Campbell maintains ICML's servers, web-pages, registration systems, payment systems, and other workflows. Without them, ICML 2018 would not have been possible.

We are extremely grateful for the sponsors who helped make ICML a success this year. In particular, their contributions were instrumental in securing registration discounts and travel funds for students who would have otherwise been unable to afford the journey to Sweden.

Finally, we want to send a warm thank you to our esteemed IMLS board members and IMLS President Joelle Pineau. Their continued guidance has been crucial this year. On behalf of all of us at ICML 2018, enjoy the conference and see you in Stockholm!

Imitation Learning

Yisong Yue (Caltech)
Hoang M Le (Caltech)

Location: Victoria

We aim to present to researchers and industry practitioners a broad overview of imitation learning techniques and recent applications. Imitation learning is a powerful and practical alternative to reinforcement learning for learning sequential decision-making policies. Also known as learning from demonstrations or apprenticeship learning, imitation learning has benefited from recent progress in core learning techniques, increased availability and fidelity of demonstration data, as well as the computational advancements brought on by deep learning. We expect the tutorial to be highly relevant for researchers & practitioners who have interests in reinforcement learning, structured prediction, planning and control. The ideal audience member should have familiarity with basic supervised learning concepts. No knowledge of reinforcement learning techniques will be assumed.

and finally introduce advanced concepts such as marks and dynamical systems with jumps. In the second and third parts of the tutorial, we will explain how temporal point processes have been used in developing a variety of recent machine learning models and control algorithms, respectively. Therein, we will revisit recent advances related to, e.g., deep learning, Bayesian nonparametrics, causality, stochastic optimal control and reinforcement learning. In each of the above parts, we will highlight open problems and future research to facilitate further research in temporal point processes within the machine learning community.

Machine Learning in Automated Mechanism Design for Pricing and Auctions

Nina Balcan (CMU)
Tuomas Sandholm (CMU)
Ellen Vitercik (CMU)
Location: A9

Mechanism design is a field of game theory with tremendous real-world impact, encompassing areas such as pricing and auction design. A powerful approach in this field is automated mechanism design, which uses machine learning and optimization to design mechanisms based on data. This automated approach helps overcome challenges faced by traditional, manual approaches to mechanism design, which have been stuck for decades due to inherent computational complexity challenges: the revenue-maximizing mechanism is not known even for just two items for sale! In this tutorial, we cover the rapidly growing area of automated mechanism design for revenue maximization. This encompasses both the foundations of batch and online learning (including statistical guarantees and optimization procedures), as well as real-world success stories.

Learning with Temporal Point Processes

Manuel Gomez Rodriguez (MPI)
Isabel Valera (MPI)

Location: K1 + K2

In recent years, there has been an increasing number of machine learning models, inference methods and control algorithms using temporal point processes. They have been particularly popular for understanding, predicting, and enhancing the functioning of social and information systems, where they have achieved unprecedented performance. This tutorial aims to introduce temporal point processes to the machine learning community at large. In the first part of the tutorial, we will first provide an introduction to the basic theory of temporal point processes, then revisit several types of points processes,

TUTORIAL SESSION 2 - 1:00 - 3:15 PM

**Toward Theoretical
Understanding of Deep Learning**Sanjeev Arora (Princeton U., Inst. For
Advanced Study)**Location:** Victoria

We survey progress in recent years toward developing a theory of deep learning. Works have started addressing issues such as: (a) the effect of architecture choices on the optimization landscape, training speed, and expressiveness (b) quantifying the true “capacity” of the net, as a step towards understanding why nets with hugely more parameters than training examples nevertheless do not overfit (c) understanding inherent power and limitations of deep generative models, especially (various flavors of) generative adversarial nets (GANs) (d) understanding properties of simple RNN-style language models and some of their solutions (word embeddings and sentence embeddings). While these are early results, they help illustrate what kind of theory may ultimately arise for deep learning.

**Defining and Designing
Fair Algorithms**Sam Corbett-Davies (Stanford)
Sharad Goel (Stanford)**Location:** K1 + K2

Machine learning algorithms are increasingly used to guide decisions by human experts, including judges, doctors, and managers. Researchers and policymakers, however, have raised concerns that these systems might inadvertently exacerbate societal biases. To measure and mitigate such potential bias, there has recently been an explosion of competing mathematical definitions of what it means for an algorithm to be fair. But there’s a problem: nearly all of the prominent definitions of fairness suffer from subtle shortcomings that can lead to serious adverse consequences when used as an objective. In this tutorial, we illustrate these problems that lie at the foundation of this nascent field of algorithmic fairness, drawing on ideas from machine learning, economics, and legal theory. In doing so we hope to offer researchers and practitioners a way to advance the area.

**Understanding your
Neighbors: Practical
Perspectives From
Modern Analysis**Sanjoy Dasgupta (UCSD)
Samory Kpotufe (Princeton)**Location:** A9

Nearest-neighbor methods are among the most ubiquitous and oldest approaches in Machine Learning and other areas of data analysis. They are often used directly as predictive tools, or indirectly as integral parts of more sophisticated modern approaches (e.g. recent uses that exploit deep representations, uses in geometric graphs for clustering, integrations into time-series classification, or uses in ensemble methods for matrix completion). Furthermore, they have strong connections to other tools such as classification and regression trees, or even kernel machines, which are all (more sophisticated) forms of local prediction. Interestingly, our understanding of these methods is still evolving, with many recent results shedding new insights on performance under various settings describing a range of modern uses and application domains. Our aim is to cover such new perspectives on k-NN, and in particular, translate new theoretical insights (with practical implications) to a broader audience.

TUTORIAL SESSION 3 - 3:45 - 6:00 PM

Variational Bayes and Beyond: Bayesian Inference for Big Data

Tamara Broderick (MIT)

Location: Victoria

Bayesian methods exhibit a number of desirable properties for modern data analysis—including (1) coherent quantification of uncertainty, (2) a modular modeling framework able to capture complex phenomena, (3) the ability to incorporate prior information from an expert source, and (4) interpretability. In practice, though, Bayesian inference necessitates approximation of a high-dimensional integral, and some traditional algorithms for this purpose can be slow—notably at data scales of current interest. The tutorial will cover modern tools for fast, approximate Bayesian inference at scale. One increasingly popular framework is provided by “variational Bayes” (VB), which formulates Bayesian inference as an optimization problem. We will examine key benefits and pitfalls of using VB in practice, with a focus on the widespread “mean-field variational Bayes” (MFVB) subtype. We will highlight properties that anyone working with VB, from the data analyst to the theoretician, should be aware of. In addition to VB, we will cover recent data summarization techniques for scalable Bayesian inference that come equipped with finite-data theoretical guarantees on quality. We will motivate our exploration throughout with practical data analysis examples and point to a number of open problems in the field.

Machine Learning for Personalised Health

Danielle Belgrave

(Microsoft Research)

Konstantina Palla (Microsoft Research)

Lamiae Azizi (U of Sydney)

Location: K1 + K2

Machine learning advances are opening new routes to more precise healthcare, from the discovery of disease subtypes for patient stratification to the development of personalised interactions and interventions. As medicine pivots from treating diagnoses to treating mechanisms, there is an increasing need for personalised health through more intelligent feature extraction and phenotyping. This offers an exciting opportunity for machine learning techniques to impact healthcare in a meaningful way, by putting patients at the centre of research. Health presents some of the most challenging and under-investigated domains of machine learning research. This tutorial presents a timely opportunity to engage the machine learning community with

the unique challenges presented within the healthcare domain as well as to provide motivation for meaningful collaborations within this domain. We will evaluate the current drivers of machine learning in healthcare and present machine learning strategies for personalised health. Some of the challenges we will address include, but are not limited to, integrating heterogeneous types of data to understand disease subtypes, causal inference to understand underlying disease mechanisms, learning from “small” labelled data, striking a balance between privacy, transparency, interpretability and model performance. This tutorial will be targeted towards a broad machine learning audience with various skill sets, some of whom may not have encountered practical applications. The main goal is to transmit inter- as well as intra- disciplinary thinking, to evaluate problems across disciplines as well as to raise awareness of context-driven solutions which can draw strength from using multiple areas of critique within the machine learning discipline. No background in healthcare or medicine is needed.

Optimization Perspectives on Learning to Control

Benjamin Recht (UC Berkeley)

Location: A9

Given the dramatic successes in machine learning over the past half decade, there has been a resurgence of interest in applying learning techniques to continuous control problems in robotics, self-driving cars, and unmanned aerial vehicles. Though such applications appear to be straightforward generalizations of reinforcement learning, it remains unclear which machine learning tools are best equipped to handle decision making, planning, and actuation in highly uncertain dynamic environments.

This tutorial will survey the foundations required to build machine learning systems that reliably act upon the physical world. The primary technical focus will be on numerical optimization tools at the interface of statistical learning and dynamical systems. We will investigate how to learn models of dynamical systems, how to use data to achieve objectives in a timely fashion, how to balance model specification and system controllability, and how to safely acquire new information to improve performance. We will close by listing several exciting open problems that must be solved before we can build robust, reliable learning systems that interact with an uncertain environment.

Intelligence per Kilowatt-hour

In the 19th century the world was revolutionized because we could transform energy into useful work. The 21st century is revolutionized due to our ability to transform information (or data) into useful tools. Driven by Moore's law and the exponential growth of data, artificial intelligence is permeating every aspect of our lives. But intelligence is not for free, it costs energy, and therefore money. Evolution has faced this problem for millions of years and made brains about a 100x more energy efficient than modern hardware (or, as in the case of the sea-squirt, decided that it should eat its brain once it was no longer necessary). I will argue that energy will soon be one of the determining factors in AI. Either companies will find it too expensive to run energy hungry ML tools (such as deep learning) to power their AI engines, or the heat dissipation in edge devices will be too high to be safe. The next battleground in AI might well be a race for the most energy efficient combination of hardware and algorithms.

In this talk I will discuss some ideas that could address this problem. The technical hammer that I will exploit is the perfect reflection of the energy versus information balancing act we must address: the free energy, which is the expected energy minus the entropy of a system. Using the free energy we develop a Bayesian interpretation of deep learning which, with the appropriate sparsity inducing priors, can be used to prune both neurons and quantize parameters to low precision. The second hammer I will exploit is sigma-delta modulation (also known as herding) to introduce spiking into deep learning in an attempt to avoid computation in the absence of changes.

Language to Action: towards Interactive Task Learning with Physical Agents

Language communication plays an important role in human learning and skill acquisition. With the emergence of a new generation of cognitive robots, empowering these physical agents to learn directly from human partners about the world and joint tasks becomes increasingly important. In this talk, I will share some recent work on interactive task learning where humans can teach physical agents new tasks through natural language communication and demonstration. I will give examples of language use in interactive task learning and discuss multiple levels of grounding that are critical in this process. I will demonstrate the importance of common-sense knowledge, particularly the acquisition of very basic physical causality knowledge, in grounding human language to actions not only perceived but also performed by the agent. As humans and agents often have mismatched capabilities and knowledge, I will highlight the role of collaboration in communicative grounding to mediate differences and strive for a common ground of joint representations.

Building Machines that Learn and Think Like People

Recent successes in artificial intelligence and machine learning have been largely driven by methods for sophisticated pattern recognition, including deep neural networks and other data-intensive methods. But human intelligence is more than just pattern recognition. And no machine system yet built has anything like the flexible, general-purpose commonsense grasp of the world that we can see in even a one-year-old human infant. I will consider how we might capture the basic learning and thinking abilities humans possess from early childhood, as one route to building more human-like forms of machine learning and thinking.

At the heart of human common sense is our ability to model the physical and social environment around us: to explain and understand what we see, to imagine things we could see but haven't yet, to solve problems and plan actions to make these things real, and to build new models as we learn more about the world. I will focus on our recent work reverse-engineering these capacities using methods from probabilistic programming, program induction and program synthesis, which together with deep learning methods and video game simulation engines, provide a toolkit for the joint enterprise of modeling human intelligence and making AI systems smarter in more human-like ways.

Biography:

Joshua Brett Tenenbaum is Professor of Cognitive Science and Computation at the Massachusetts Institute of Technology. He is known for contributions to mathematical psychology and Bayesian cognitive science. He previously taught at Stanford University, where he was the Wasow Visiting Fellow from October 2010 to January 2011. Tenenbaum received his undergraduate degree in physics from Yale University in 1993, and his Ph.D. from MIT in 1999. His work primarily focuses on analyzing probabilistic inference as the engine of human cognition and as a means to develop machine learning.
